

Experiment No:6
Word Sense Disambiguation

AIM: Find synonyms and hyponyms using Python nltk and WordNet
Get all the hyponyms and hypernyms for a given word
Get all Hyponyms with synsetID

Theory:

Wordnet is a large collection of words and vocabulary from the English language that are related to each other and are grouped in some way. That's the reason WordNet is also called a lexical database.

WordNet groups nouns, adjectives, verbs which are similar and calls them synsets or synonyms. A group of synsets might belong to some other synset. **Synset** is a special kind of a simple interface that is present in NLTK to look up words in WordNet. Synset instances are the groupings of synonymous words that express the same concept. For example, the synsets "Brick" and "concrete" belong to the synset "Construction Materials" or the synset "Brick" also belongs to another synset called "brickwork ". In the example given, brick and concrete are called hyponyms of synset construction materials and also the synsets construction material and brickwork are called synonyms.

CODE:

```
from nltk.corpus import wordnet as wn
import nltk
# nltk.download('omw-1.4')
# nltk.download('wordnet')

synonyms = []

word = "home"

for syn in wn.synsets(word):
    for i in syn.lemmas():
        synonyms.append(i.name())
print(f"Synonyms of {word} are: ")
print(set(synonyms))
print()
print()
hyponyms = []
print(f"Hyponyms of {word} are: ")
for syn in wn.synsets(word):
    for i in syn.hyponyms():
        hyponyms.append(i.name().split(".")[0])
print(set(hyponyms))

hypernyms = []
```

```

for syn in wn.synsets(word):
    # print(syn.hypernym_distances())
    for i in syn.hypernym_distances():
        hypernyms.append((i[0].name().split(".")[0], i[1]))
print()
print()
print(f"Hypernyms of {word} are: ")
print(set(hypernyms))

```

```

vehicle = wn.synset('vehicle.n.01')
typesOfVehicles = list(set([w for s in vehicle.closure(
    lambda s:s.hypernyms()) for w in s.lemma_names()]))

```

```

print()
print()
print(f"Hyponyms of Synset ID {vehicle} are: ")
print(set(typesOfVehicles))

```

Sample Output:

```

E:\Sem 8\NLP>python exp6.py
Synonyms of home are:
('interior', 'household', 'plate', 'menage', 'place', 'nursing_home', 'national', 'dwelling', 'domicile', 'dwelling_hous
e', 'internal', 'home', 'home_plate', 'rest_home', 'abode', 'family', 'habitation', 'base', 'house', 'home_base')

Hyponyms of home are:
('nuclear_family', 'broken_home', 'foster_home', 'menage_a_trois', 'messuage', 'home_away_from_home', 'hermitage', 'clif
f_dwelling', 'semi-detached_house', 'condominium', 'hearth', 'lodge', 'extended_family', 'yurt', 'lake_dwelling', 'homes
tead', 'vacation_home', 'foster_family', 'fixer-upper', 'house')

Hypernyms of home are:
({'point', 2), ('establishment', 2), ('travel', 2), ('baseball_equipment', 2), ('structure', 3), ('abstraction', 5), ('e
ntity', 6), ('house', 1), ('return', 1), ('physical_entity', 5), ('artifact', 3), ('shelter', 2), ('artifact', 6), ('soc
ial_group', 3), ('home', 0), ('institution', 1), ('object', 6), ('location', 3), ('point', 4), ('structure', 2), ('whole
', 5), ('geographic_point', 3), ('entity', 8), ('sports_equipment', 3), ('address', 2), ('home_plate', 0), ('physical_en
tity', 7), ('base', 1), ('object', 2), ('object', 5), ('situation', 2), ('object', 8), ('location', 5), ('supply', 3), ('
